

LEQVIO® — A SMALL INTERFERING RNA THERAPY THAT SELECTIVELY TARGETS THE LIVER TO REGULATE LDL-C LEVELS IN PATIENTS WITH HYPERCHOLESTEROLEMIA

LEQVIO®
(inclisiran) injection
284 mg/1.5 mL

HOW IS LDL-C REGULATED?

Cholesterol circulates in plasma within lipoprotein particles.^{1,2} Uptake of these particles by the liver is one of several tightly coordinated processes that maintain cholesterol homeostasis.¹

HOW LEQVIO WORKS

RNA interference (RNAi) is a biological process that regulates gene expression by inhibiting translation of specifically targeted messenger RNA (mRNA) into proteins.⁴ Therapies such as small interfering RNAs (siRNAs) have been developed to mimic the body's process of RNAi.⁵ LEQVIO is an siRNA therapy that was assessed for its efficacy and safety as an LDL-C-lowering therapy.³

STUDIES HAVE SHOWN LEQVIO TO HAVE HIGH SELECTIVITY FOR THE LIVER WITH REDUCED UPTAKE IN OTHER ORGANS⁴

INDICATION

LEQVIO (inclisiran) injection is indicated as an adjunct to diet and exercise to reduce low-density lipoprotein cholesterol (LDL-C) in adults with hypercholesterolemia, including heterozygous familial hypercholesterolemia (HeFH).

IMPORTANT SAFETY INFORMATION

LEQVIO is contraindicated in patients with a prior serious hypersensitivity reaction to inclisiran or any of the excipients in LEQVIO. Serious hypersensitivity reactions have included angioedema. Adverse reactions in clinical trials (≥3% of patients treated with LEQVIO and more frequently than placebo) were injection site reaction, arthralgia, and bronchitis.
